Claim Amendments

1. (Currently Amended) A method comprising:

a system detecting an occurrence of a predetermined event, wherein the predetermined event is a cache of the hard disk reaching a predetermined level of dirty data, the predetermined level is to be reached before the cache of the hard disk is full of dirty data; and

in response to detecting the event, spinning up a hard disk of the system prior to a request to exchange data with the hard disk.

- 2. (Cancelled)
- 3. (Currently Amended) The method of claim 1 2, wherein the cache of the hard disk consists of nonvolatile memory.
- 4. (Currently Amended) The method of claim 1, wherein the predetermined event <u>further</u> includes detecting a presence of a system user.
- 5. (Currently Amended) The method of claim 1, wherein the predetermined event <u>further</u> includes detecting one of movement and activation of one of an input device and a pointing device.
- 6. (Currently Amended) The method of claim 1, wherein the predetermined event <u>further</u> includes detecting movement of a mouse or activation of a key on a keyboard.
- 7. (Currently Amended) A machine readable medium having stored thereon a set of instructions which when executed cause a system to perform a method comprising of:

the detecting an occurrence of a predetermined event, wherein the predetermined even is a cache of the hard disk reaching a predetermined level of dirty data, the predetermined level is to be reached before the cache of the hard disk is full of dirty data; and

in response to detecting the event, spinning up a hard disk of the system prior to a request to exchange data with the hard disk.

- 8. (Cancelled)
- 9. (Currently Amended) The machine readable medium of claim 7 8, wherein the cache of the hard disk consists of nonvolatile memory.
- 10. (Currently Amended) The machine readable medium of claim 7, wherein the predetermined event <u>further</u> includes detecting a presence of a system user.
- 11. (Currently Amended) The machine readable medium of claim 7, wherein the predetermined event <u>further</u> includes detecting one of movement and activation of one of an input device and a pointing device.
- 12. (Currently Amended) A system comprising:
 - a processor;
 - a non-volatile cache coupled to the processor; and
- a machine readable medium having stored thereon a set of instructions which when executed cause the system to perform a method comprising of:

detecting an occurrence of a predetermined event, wherein the predetermined even is a cache of the hard disk reaching a predetermined level of dirty data, the predetermined level is to be reached before the cache of the hard disk is full of dirty data; and

in response to detecting the event, spinning up a hard disk of the system prior to a request to exchange data with the hard disk.

- 13. (Cancelled)
- 14. (Currently Amended) The system of claim 12 13, wherein the cache is a non-volatile cache of a hard disk of the system.

- 15. (Currently Amended) The system of claim 12, wherein the predetermined event <u>further</u> includes detecting a presence of a system user.
- 16. (Currently Amended) The system of claim 12, wherein the predetermined event <u>further</u> includes detecting one of movement and activation of one of an input device and a pointing device.
- 17. (Currently Amended) The system of claim 12, wherein the predetermined event <u>further</u> includes detecting movement of a mouse or activation of a key on a keyboard.
